Design Patterns for Embedded Systems in C: An Embedded ... Popular design patterns used in embedded systems are listed below: Observer pattern: Also known as the publish-subscribe method. It is a method which allows data to be shared to multiple elements and makes it easy to add more elements to share the data. Thus the system becomes more flexible.

The design is still simple but the execution time of the functions within the medium priority task could introduce timing issues. The separation of the embedded web server task reduces this risk and in any case any such issues would not effect the plant control task.

of the book states: The author carefully takes into account the special concerns found in designing and developing embedded applications specifically concurrency, communication, speed, and memory usage.

Design / Implementation Patterns for Embedded Systems

Patterns are given for a number of important embedded tasks, like the creation of state machines and working with multitasking. There were two I found particularly appealing. The first is the observer pattern. This is another name for publish/subscribe, an approach that is increasingly found in complex systems.

Design patterns & Real-time programming for embedded devices with OS Assembler programs are often hardware specific and not very portable and modular. This makes programming of big complex system rather difficult. This can be solved by using an 'abstraction layer' that handles the processor and the hardware interfacing.
