This book is written for hospital doctors, nurses, biochemists, medical laboratory scientific officers and phlebotomists involved with the biochemical investigation of patients. It is hoped, also, that general practitioners and medical students will find it of help. Whilst the vast majority of biochemical tests assess the level of constituents in blood and urine at a given point in time, an important additional parameter is the assessment of physiological reserve function by means of loading tests, prolonged fasting, exercise and clearance studies. The protocol and interpretation of response of each of these stress tests form the main basis of the text. An attempt has been made to be reasonably

comprehensive in the range of tests described; hence, not only have some rather older ones been retained, but also some very recently introduced ones included. It is appreciated that practice varies widely from laboratory to laboratory with respect to protocol, sample collection, methodology and quotation of reference ranges, and no doubt also from clinician to clinician, particularly regarding interpretation of results. In paediatric work, micromethods will demand much smaller volumes of blood than those stated here, which relate generally to adult medicine. The account, therefore, must be seen as a guide to practice rather than as a recipe; it is in no way an attempt to standardise procedures, which depend on the local requirements.

Covering anatomical, clinical, pathological and laboratory aspects of surgical histopathology specimens, *Histopathology Specimens: Clinical, Pathological and Laboratory Aspects, Second Edition* relates specimen dissection and its clinical context to relevant histopathology reports, and therefore a more comprehensive patient prognosis and management is possible. *Histopathology Specimens: Clinical, Pathological and Laboratory Aspects, Second Edition* explains pathological and clinical terminology, including a glossary of clinical request form abbreviations. A standardised step-wise approach to specimen handling is illustrated with simple line diagrams and highlights essentials of the histopathology report, relating them to appropriate specimen dissection. The integrated multidisciplinary team approach taken to the modern clinical management of patients is reflected by correlating patient presentation, diagnostic and staging investigations with histopathology specimens. Current WHO and TNM tumor classifications are referenced. *Histopathology Specimens: Clinical, Pathological and Laboratory Aspects, Second Edition* will be of educative value and act as a reference tool for the medical undergraduate student, medical trainee in histopathology and the biomedical scientist, and as a useful aide memoire for the histopathology consultant.
