I recently bought Bate et al's Fundamentals of Astrodynamics. While some of the practice problems have solutions in the text, I have not been able to find a solution manual for the whole text. I was wondering if there exists a list of full solutions somewhere or if I'll just have to trust that my math is correct.

Orbital mechanics or astrodynamics is the application of ballistics and celestial mechanics to the practical problems concerning the motion of rockets and other spacecraft. The motion of these objects is usually calculated from Newton's laws of motion and law of universal gravitation. Orbital mechanics is a core discipline within space-mission design and control.

When the United States Air Force Academy began teaching astrodynamics to undergraduates majoring in astronautics or aerospace engineering, it found that the traditional approach to the subject was well over 100 years old. An entirely new text had to be evolved, geared to the use of high speed digital computers and actual current practice in the industry.
