A.-C. Charles (1746–1823)—states that, at constant pressure, the volume V of a gas is directly proportional to its absolute (Kelvin) temperature T, or V/T = k. These two laws can be combined to form the ideal gas law, a single generalization of the behaviour of gases known as an equation of state, PV = nRT, where n is the number of gram-moles of a gas and R is called the universal gas constant. Though this law describes the behaviour of an ideal gas, it closely approximates the behaviour ...

Volume and pressure in gases – the gas laws Boyle ' s law. Decreasing the volume of a gas increases the pressure of the gas. An example of this is when a gas is trapped in a cylinder by a piston.

Volume and pressure in gases – the gas laws - Temperature ...

The initial volume and initial pressure here is p 1 and V 1 then according to Boyle ' s law: p 1 x V 1 = p 2 x V 2 = constant (k 1) p 1 /p 2 = V 2 /V 1. So according to Boyle ' s law, if the pressure is doubled then at constant temperature the volume of that gas is reduced to half.

In 1787, French physicists Jacques Charles, discovered the correlation between Temperature (T) and Volume (V) (assuming Pressure (P) and Amount of Gas (n) remain constant): (Gas Laws.7) V T V = y T. where y is a constant depending on amount of gas and pressure. Volume is directly proportional to Temperature.

At a constant temperature, the volume of a gas varies inversely with the pressure, while the density of a gas varies directly with pressure. If the temperature is constant and air pressure increases, the density of the air increases also, while the volume decreases and vice versa. As a diver, Boyles law affects you every time you enter the water.

The pressure of a gas is inversely proportional to its volume when temperature is constant. The product of pressure and volume is constant when temperature is constant. This relationship is known as Boyle's law or Mariotte's law. A constant temperature process is said to be isothermal.
