We demonstrate a tunable-focus lens using a spherical glass shell and a homogeneous liquid crystal (LC) cell. The inner surface of the glass shell and the bottom surface of the LC cell are coated with indium tin oxide (ITO) electrodes while the LC layer is sandwiched between the spherical and flat ITO electrodes. When a voltage is applied to the electrodes, a centro-symmetric gradient ...

Liquid crystal (LC) lenses which are active optical elements with electrically tunable focal lengths have many applications, such as three-dimensional displays, imaging systems, micro- scopes, zoom systems and optical tweezers [1-9]. The features of the low power consumption and the thin thickness of LC lenses are promising for portable devices.

In this paper, we develop a method to prepare a liquid crystal (LC) lens using photoalignment technology. It's fabricated by utilizing variable pretilt angles of a photoalignment layer. By irradiating a Gaussian profile laser beam on a photoalignment layer, variable angles from 1° to 89° are formed.

The simplest adaptive contact lens uses a nematic liquid crystal contained within an electrically active cavity with a varying thickness d to form a meniscus lens, as shown in Figure 1. 4, 5 The refractive index of the lens substrate is matched to the ordinary index of the liquid crystal so that there is no lensing effect for the vertical state.

To achieve smooth varifocal, we address the full stack of liquid crystal lenses, with each additional pair doubling the number of focal planes. In the example above, six liquid crystal lenses are driven to sweep through 64 focal planes, and you can see the focal depth smoothly changing at the right as we cycle through different sets of lens states.

The liquid crystal lens would then be inserted, restoring clear vision. The lens could also have application in tackling cataracts - the clouding of natural lenses - which affect many people in later life and which can seriously affect vision. A common treatment is to remove and replace the natural lens.
