This book presents a thorough and critical evaluation of the monetary and financial system prevalent in Western economies. Further, it seeks to explain why this system so often leads to financial crises and why they have been dealt with unsatisfactorily in the past. In order to provide answers to these questions, the book investigates the monetary and financial system from a multidisciplinary perspective, with a strong focus on the ethical value choices which throughout history have shaped the monetary and financial legal system. In the closing chapters, the book also advances a detailed proposal for a New Global Monetary Order, one based on altruism, as an alternative to the neoliberal values dominant today.

To support the understanding that banks' debt issuance means money creation, while centralized nonbank financial institutions' and decentralized bond market intermediary lending does not, the paper aims to convey two related points: First, the notion of money creation as a result of banks' loan creation is compatible with the notion of liquid funding needs in a multi-bank system, in which liquid fund (reserve) transfers across banks happen naturally. Second, interest rate-based monetary policy has a bearing on macroeconomic dynamics precisely due to that multi-bank structure. It would lose its impact in the hypothetical case that only one ("singular") commercial bank would exist. We link our discussion to the emergence and design of central bank digital currencies (CBDC), with a special focus on how loans would be granted in a CBDC world.
