Nmap (“ Network Mapper ”) is an open source tool for network exploration and security auditing. It was designed to rapidly scan large networks, although it works fine against single hosts. Nmap uses raw IP packets in novel ways to determine what hosts are available on the network, what services (application name and version) those hosts are offering, what operating systems (and OS versions ...

Chapter 15. Nmap Reference Guide | Nmap Network Scanning

Nmap Reference Guide. The primary documentation for using Nmap is the Nmap Reference Guide. This is also the basis for the Nmap man page (nroff version of nmap.1). It is regularly updated for each release and is meant to serve as a quick-reference to virtually all Nmap command-line arguments, but you can learn even more about Nmap by reading it straight through.

...

To get started. This is a simple command for scanning your local network (class C or /24): `nmap -sV -p 1-65535 192.168.1.1/24`. This command will scan all of your local IP range (assuming your in the 192.168.1.0-254 range), and will perform service identification -sV and will scan all ports -p 1-65535.

Nmap Tutorial: from the Basics to Advanced Tips

On average Nmap sends 5-10 fewer packets per host, depending on network conditions. If a single subnet is being scanned (i.e. 192.168.0.0/24) Nmap may only have to send two packets to most hosts.-n (no DNS resolution) Tells Nmap to never do reverse DNS resolution on the active IP addresses it finds. Since DNS can be slow even with Nmap's built-in parallel stub resolver, this option can slash scanning times.
