Medication - choice and managing problems. Your doctor may offer you medication if you experience symptoms of a mental illness. Sometimes you might not want to take medication or feel it is not right for you. This page explains how you can try and deal with problems with medication.

Drug overdose, driven largely by overdose related to the use of opioids, is now the leading cause of unintentional injury death in the United States. The ongoing opioid crisis lies at the intersection of two public health challenges: reducing the burden of suffering from pain and containing the rising toll of the harms that can arise from the use of opioid medications. Chronic pain and opioid use disorder both represent complex human conditions affecting millions of Americans and causing untold disability and loss of function. In the context of the growing opioid problem, the U.S. Food and Drug Administration (FDA) launched an Opioids Action Plan in early 2016. As part of this plan, the FDA asked the National Academies of Sciences, Engineering, and Medicine to convene a committee to update the state of the science on pain research, care, and education and to identify actions the FDA and others can take to respond to the opioid epidemic, with a particular focus on informing FDA's development of a formal method for incorporating individual and societal considerations into its risk-benefit framework for opioid approval and monitoring.

Medication Management in Care of Older People is an accessible introduction to medication management and its role in the management of older people and their medicines. It addresses key issues in medication management, evaluates professional roles and clinical practice initiatives and explores healthcare policy and prescribing initiatives. This text explores the biology and neurobiology of ageing, pathological conditions such as Parkinson's and Alzheimer's disease, medication errors, issues

of concordance, long term conditions and the older person, the principles of applied pharmacology and its relationship to older people. Medication Management in Care of Older People will be of interest to health care professionals who either have an interest in medication management and older people, or who are qualified independent or supplementary prescribers, and will enable them to comprehend the principles of applied pharmacology and medication management to enable them to use this knowledge in their daily practice. Illustrates the current issues, concerns and approaches used to manage older people and their medicines. Builds on pertinent current policy and research initiatives including the NSF for Older People and 'Building a Safer NHS for Patients: the role of medication safety' Each chapter features case studies, learning outcomes and implications for practice "I found this book to be interesting and highly relevant to OT practice. I would recommend this book as a learning resource to inform, review and support clinical therapy practice. Occupational Therapists could well appreciate many of the contributory factors relating to medication problems with Older People, using this resource could raise own standards, but also assist with reducing the negative impacts of medication issues on older people." - Sarah Montgomery, A&E Occupational Therapist and Communications Officer, (COT Specialist Section Older People), London, UK

Experts estimate that as many as 98,000 people die in any given year from medical errors that occur in hospitals. That's more than die from motor vehicle accidents, breast cancer, or AIDS--three causes that receive far more public attention. Indeed, more people die annually from medication errors than from workplace injuries. Add the financial cost to the human tragedy, and medical error easily rises to the top ranks of urgent, widespread public problems. To Err Is Human breaks the silence that has surrounded medical errors and their consequence--but not by pointing fingers at caring health care professionals who make honest mistakes. After all, to err is human. Instead, this book sets forth a national agenda--with state and local implications--for reducing medical errors and improving patient safety through the design of a safer health system. This volume reveals the often startling statistics of medical error and the disparity between the incidence of error and public perception of it, given many patients' expectations that the medical profession always performs perfectly. A careful examination is made of how the surrounding forces of legislation, regulation, and market activity influence the quality of care provided by health care organizations and then looks at their handling of medical mistakes. Using a detailed case study, the book reviews the current understanding of why these mistakes happen. A key theme is that legitimate liability concerns discourage reporting of errors--which begs the question, "How can we learn from our mistakes?" Balancing regulatory versus market-based initiatives and public versus private efforts, the Institute of Medicine presents wide-ranging recommendations for improving patient safety, in the areas of leadership, improved data collection and analysis, and development of effective systems at the level of direct patient care. To Err Is Human asserts that the problem is not bad people in health care--it is that good people are working in bad systems that need to be made safer. Comprehensive and straightforward, this book offers a clear prescription for raising the level of patient safety in American health care. It also explains how patients themselves can influence the quality of care that they receive once they check into the hospital. This book will be vitally important to federal, state, and local health policy makers and regulators, health professional licensing officials, hospital administrators, medical educators and students, health caregivers, health journalists, patient advocates--as well as patients themselves. First in a series of publications from the Quality of Health Care in America, a project initiated by the Institute of Medicine

Joining forces is the only chance they've got Cries in the Night Haunted by her daughter's cries in the night, Melany Jackson will stop at nothing to track down her child. And if that means joining forces with Ryan Braxton--the man she still loves--then so be it. Melany and Ryan must quickly unravel the clues in the case. But what Melany fears more than her attraction to Ryan is that he might discover her child...is also his. Person of Interest By performing facial reconstruction surgeries for the CIA, Dr. Elizabeth Cameron provided new identities for agents whose covers had been blown. But someone wanted one in particular dead--and now Elizabeth is in jeopardy. As the danger escalates, her only hope rests with Agent Joe Hennessy, the one man she swore never to set eyes on again...
