Practical Animal Breeding provides comprehensive and up to date coverage of breeding and fertility in animals. Taking a practical, problem-oriented approach to the theory and practice of animal breeding and infertility, it deals systematically with the typical approaches and problems encountered in the treatment of cattle, goats, horses, pigs and sheep in individual chapters.

~~Practical Animal Breeding by Nandan, Ramesh (ebook)~~

The discussion of practical breeding plans for different species should be helpful to students to show procedures and problems, but it lacks an assessment of the effectiveness of different parts. Because of the simplicity and brevity, there are some anomalies and omissions, such as an example of a selection index, or of the method to calculate the relative economic value of different traits.

~~An introduction to practical animal breeding.~~

Visits could be made to animal breeding establishments with involvement in routine practical management of stock during their reproductive cycles (by using on/off site facilities and/or work experience placements). Learning outcome 4 is likely to be delivered by formal lectures, discussions, site visits and independent learner research.

~~Unit 32: Understand the Principles of Animal Breeding and ...~~

The udder is of great importance to breeders. In animals that suckle their own offspring it is highly desirable that the teats are of a suitable size and shape to allow the young to suckle and can stand up to the considerable chewing and wear that they get, especially where litters are involved. In such animals, the number of teats is important too.

The length of summer practical is 3 weeks (from the 3rd of July till the 21th of July). The review of 2 different animal species is required. The farm has to be a large-scale facility, preferably dealing with dairy cows, swine, sheep, goat or fish. Horse, beef cattle and poultry breeding facilities are also accepted.

~~Veterinary Genetics - University of Veterinary Medicine ...~~

Important applications of genetic engineering in animal breeding are: 1) Marker-assisted selection (MAS). The objective of this technology is to increase disease resistance, productivity and product quality in economically important animals by adding information of DNA markers to phenotypes and genealogies for selection decisions.
