The lift mechanism that was eventually built and implemented was a 3-level scissor lift. In order to analyze the forces throughout the lift structure, a set of mathematical equations was derived. From these equations it was discovered that prudent placement of a lift's actuator can significantly reduce the forces required of the actuator and the stress levels in the adjacent scissor members.

Equations and Calculators updated: April 20, 2012. A scissor lift (jack) or mechanism is device used to extend or position a platform by mechanical means. The terms "Scissor" comes from the mechanism utilized which is configured with linked, folding supports in a crisscross 'X' pattern. The extension or displacement motion is achieved applying of force to one of the supports resulting and an elongation of the crossing pattern.

Area of the bore of the cylinder = $(3.14 \cdot 70^2) / 2 = 3848 \text{mm}^2$ Pressure = $(\text{Force} / \text{Area}) = (51662.48 / 3848 \cdot 106) = 134.2 \text{bar}$ [4] 5.3 Design of Scissor Arm. For the link design, it has been considered that the entire load is acting on half of the length The length of the entire arm = 4200mm.

Design of scissor jack is done with Pro-E and model assembly is shown in Figures 1 to 3. Design Details of Jack • The total height of the screw jack = 276 mm. • The deformation of the screw jack in y direction = 2.00 mm. • Permanent set in y direction is = 0.37 mm.

DESIGN AND ANALYSIS OF SCISSOR JACK

A distinctive feature of an electro-hydraulic scissor lift in comparison with other analogues is the low price due to the use of a relatively simple design. A special lifting platform is driven by a simple metal structure with levers that look like scissors connected with others in a long chain. As a lifting force is used electro-

Hence, the weight of the scissor lift can be modelled by placing half its weight at the top, i.e. by adding half of the weight of the scissor lift to the load. Hence, for the rest of this paper, the weight of the lift will be accounted for by taking the effective load L E, for a particular load L, such that: $W = W + B C (DD) III$.
