In mathematics, to solve an equation is to find its solutions, which are the values that fulfill the condition stated by the equation, consisting generally of two expressions related by an equals sign. When seeking a solution, one or more variables are designated as unknowns. A solution is an assignment of values to the unknown variables that makes the equality in the equation true. In other words, a solution is a value or a collection of values such that, when substituted

Solution. more ... A value, or values, we can put in place of a variable (such as  $x$ ) that makes the equation true.

Example:  $x + 2 = 7$ . When we put 5 in place of  $x$  we get:  $5 + 2 = 7$ .  $5 + 2 = 7$  is true, so  $x = 5$  is a solution. See: Variable. Solving Equations.

In number theory: Diophantus. These are equations whose solutions must be whole numbers. For example, Diophantus asked for two numbers, one a square and the other a cube, such that the sum of their squares is itself a square. In modern symbols, he sought integers  $x$ ,  $y$ , and  $z$  such that  $(x^2)^2 + \dots$
