synthesizes immunological concepts into a coherent, up-to-date, and reader-friendly account of how the immune system works. Written for undergraduate, medical, veterinary, dental, and pharmacy students, it makes generous use of medical examples to illustrate points. The Fourth Edition has been extensively revised and updated. Innate immunity has undergone major revision to reflect this expanding and fast-moving field, and is now divided between two chapters: Chapter 2 "Innate Immunity: The Immediate Response to Infection," which deals with complement and other soluble molecules of innate immunity such as antimicrobial peptides, and Chapter 3 "Innate Immunity: The Induced Response to Infection," which deals mainly with the cellular response. Chapters 4-9 have been updated and material has been consolidated to eliminate repetition. Mucosal immunology has exploded as a field since the Third Edition was published, thus its coverage in chapter 10, now devoted to the topic, has been significantly expanded and updated. Also, more emphasis is placed on commensal microorganisms, particularly of the gut, and their interactions with the immune system. Immunological memory and the secondary immune response is now the first part of Chapter 11. The second part of this chapter, entitled "Vaccination to Prevent Infectious Disease," will include new and more modern material. "Bridging Innate and Adaptive Immunity" will also have its own

chapter. The remaining clinical chapters will be revised and updated with new immunotherapies, but their content and organization will remain largely the same. The Fourth Edition will be accompanied by an updated and greatly expanded question bank, as well as PowerPoints and JPEGs of all the figures in the text."--

Psychoneuroimmunology, Second Edition presents reports on the relationship between the nervous and immune systems. The book is divided into four sections. The first section details the role of neural structures and neurotransmitter signals in communication with the immune system. It documents the extensive neural connections with organs of the immune system; the dynamics of noradrenergic sympathetic innervation of spleen and thymus; and the evidence for immune signaling of the CNS. Part II

elaborates the role of hormones in the modulation of immune functions; the basis for bidirectional communication between the neuroendocrine and immune systems; and the potential physiological implications of these neuroendocrine-immune system interactions. The third part addresses behavioral influences on immune response; the effects of conditioning, stress and social interactions in modulating immune responses; and the behavioral consequences of experimentally altered or genetically determined immunologic states. The final section presents the effects of psychosocial factors on immune responses and the potential impact of behavioral interventions in modulating immunity in healthy human subjects and in patients with AIDS. Neuroscientists, endocrinologists, and immunologists will find the book interesting.
