What is Unix ? The Unix operating system is a set of programs that act as a link between the computer and the user. The computer programs that allocate the system resources and coordinate all the details of the computer's internals is called the operating system or the kernel. Users communicate with the kernel through a program known as the shell.

The Unix Shell When you log into UNIX/LINUX system, then it starts a program called the Shell. It provides you with a working environment and interface to the operating system. Usually there are several different shell programs installed. The shell program bash is one of the most common ones.

Linux Basics - Manuals

Adding new user accounts in Unix. To create a basic Unix user account with default settings, you need to know only one thing: the username. The reason I say it as one word is because username (quite often referred to as “login”) is not the actual name of the new person gaining access to your Unix system, but rather a single keyword uniquely identifying this user in your system.

How To Create User Accounts in Unix

This guide was created as an overview of the Linux Operating System, geared toward new users as an exploration tour and getting started guide, with exercises at the end of each chapter. For more advanced trainees it can be a desktop reference, and a collection of the base knowledge needed to proceed with system and network administration.

in to a multi-user computer from another computer, over a network. Multi-user operating systems, such as Unix and VMS, usually present a command-line interface to the user, much like the 'Command Prompt' or 'MS-DOS Prompt' in Windows. The system prints a prompt, and you type commands which the system will obey.
